PHƯƠNG PHÁP & GIẢ ĐỊNH

PD = Default hoặc Charged Off / outcome cuối cùng. Current, Late và In Grace Period không nằm trong mẫu matured.

LGD và EAD là proxy: funded amount đại diện exposure; LGD proxy dùng tổn thất ròng sau recoveries. Expected Loss Proxy = PD × LGD × EAD.

Vintage = năm issue_d. Contribution Amount = lãi đã thu − tổn thất ròng − chi phí vốn − chi phí vận hành; chi phí tính trên dư nợ bình quân × số năm (suy ra từ lãi đã thu / APR). Contribution Margin = Contribution / funded; Contribution Rate = Contribution / dư nợ bình quân (theo năm). Chi phí mặc định 4% và 1%/năm, chỉnh bằng slicer trên trang Vintage. Default Rate 12/24/36M: khoản vỡ nợ tính tại tháng trả tiền cuối, mẫu số chỉ gồm khoản đã giải ngân đủ N tháng trước ngày chốt dữ liệu, nên so sánh được giữa các vintage. Matured Contribution Margin chỉ tính khoản đã đóng nên là cận dưới (vintage non bị kéo xuống bởi vỡ nợ sớm); Contribution Margin là cận trên. Prepayment Rate 24M tính như Default Rate 24M.

Cảnh báo maturity bias, selection bias, vintage comparability.

Không dùng biến hậu giải ngân cho phê duyệt: loan_status, total_pymnt, total_pymnt_inv, total_rec_int, recoveries, collection_recovery_fee, hardship_*, settlement_*, last_pymnt_d.
